# THE “HIGH-PERFORMER” TRAP

When Individual Talent Masks Weak Systems —  
and How to Build a Culture That Performs

## *From* **HIGH PERFORMERS** *to* **A HIGH- PERFORMANCE CULTURE**

# THE CASE FOR CHANGE AND WHY IT'S HARD

Professional services firms will tell me that they are “high-performance” organisations because their people are talented, driven, get the job done, and win more business. Their partners are great at business development, they can build trusting relationships, and they are all technical experts.

**However, a collection of high performers does not automatically translate into a high-performance culture.**

In fact, the very dynamics that create and sustain successful individual performers often undermine collective performance at the firm level, especially as firms grow in size and scope.

The transition from  
**collection of individual  
performers to a coordinated  
high-performance system**

is one of the most important  
shifts a professional services  
firm can make.

It's also one of the most difficult shifts.

### HERE'S WHY:

It can seem counterintuitive to believe that what made each of us great doesn't automatically translate to collective greatness

It can feel risky to step away from what got us here, usually based on a sense of close connection (*we are like family*) or a few perennial high performers, to an entirely different way of doing business.

It requires a whole new set of individual and team leadership skills beyond being a gun consultant.

The fault-lines created by the lack of coherence at the leadership level are a lagging indicator, often only developing insidiously over time. ***Everyone else is still getting on with the work and the work is coming in, so what's the problem?***

If professional services firms want to continue to expand, increase market share, and build revenue, here's an inevitable truth. **What got us this far will not get us where we want to go.**

This paper describes this problem and outlines the solutions that accelerate the transition to the next level of sustainable success.

[AI Disclaimer: The ideas and graphics are mine. I used AI to augment research sources and, in some places, to streamline how concepts were presented.]

# THE PERFORMANCE EVOLUTION MODEL

This model describes the typical and predictable stages of firm growth, along with the risks associated at each level.

Growth Stage	Identity	Leadership Style	Organising Principle	Risk
Startup	Gun consultants	Siloed	Hustle/ Informality	Chaos
Scaling	Emergent leadership group	Conditional alignment	Inconsistency	Covert resistance
High-performance culture	Collective stewardship	Aligned and system-oriented	Coherence	Complacency

# THE “BIG 3” ELEPHANTS IN THE ROOM

## System and Leadership Frictions

On the journey from individual to cultural excellence, there are a few common performance pitfalls that need to be called out. These powerful “elephants in the room” are very often unseen and yet so often slow or even stop attempts to address system performance improvement.

These pitfalls have to do with built-in weaknesses to the professional services business model, motivational myths and realities, and the counterintuitive side-effects for leaders labelled as high performers.

## The Marshmallow

Professional services firms exist, in addition to any other performance or market metrics, to generate returns for their partners. And why not?

The business model is simple and largely effective: work hard, get promoted, and get rewarded for those years of grinding with a great salary, partnership, and the big pay-off: firm equity.

But once you see the firm (and partner motivations) through that financial lens, a different logic may insidiously kick in. Partners start to ask:

**Why invest in systems, leadership, or culture when those investments reduce this year's profit?**

**Why take money off the table today for a payoff that comes later, if at all?**

If the game is short-term, the rational move is obvious: maximise today. In other words? **Eat the marshmallow now.**

This idea comes from the Stanford University marshmallow experiment where children were given a simple choice: eat one marshmallow now or wait 15 minutes...and receive two later.

Some children waited. Many didn't.

### Here's what's interesting.

Children who were willing to delay gratification and waited to receive the second marshmallow ended up years later with higher SAT scores, lower levels of substance abuse, lower likelihood of obesity, better responses to stress, and better social skills.

To be clear, the interesting part wasn't the choice in the moment. It was what that choice represented: an orientation toward the future and an understanding that delaying gratification can have an outsized payoff down the road.

### The broader business landscape tells the same story.

Research from Innosite shows the average lifespan of companies on the S&P 500 has shrunk dramatically over the past half-century, from around 60 years to less than 20. The issue is rarely a lack of talent. More often, organizations fail to adapt fast enough to changing conditions.

The firms that endure make a different choice. **They resist the instinct to optimise only for today.** They recognise that sustained performance doesn't just keep delivering. It requires an eye to the future and emphasis on to the systems and processes that drive it.

**They leave the marshmallow on the table.**

Consider these real-life business examples as reported by HBR:

**BLOCKBUSTER CHOSE TO OPTIMISE ITS EXISTING RETAIL MODEL RATHER THAN ADAPT TO STREAMING, LEAVING IT EXPOSED AS CONSUMER BEHAVIOUR SHIFTED – AND ULTIMATELY OBSOLETE.**

**AMAZON CONSISTENTLY REINVESTED PROFITS INTO INFRASTRUCTURE, TECHNOLOGY, AND NEW CAPABILITIES, DELAYING SHORT-TERM RETURNS IN FAVOUR OF LONG-TERM DOMINANCE AND RESILIENCE.**

Here's what this dilemma looks like over time:

TIME (0 – 3 years)

Collection of high-performing individuals  
High-performance culture and systems

TIME (0 – 3 years)

Collection of high-performing individuals  
High-performance culture and systems

In the short term, investing in long-term growth limits profitability and takes effort. Lagging benefits can take anywhere from one to three years to break even, but then the disparity in trajectories is obvious.

## The Treadmill

If the first elephant is short-termism (*eat the marshmallow now*), the second is more subtle—and arguably more corrosive over time.

**It's the belief that money, on its own, is a reliable and scalable motivator of sustained performance.**

Most professional services leaders have lived some version of this frustration: *We pay people extremely well. So why aren't they performing or sustaining at the level we expect?*

The assumption embedded in that question is worth challenging. It assumes a relatively linear relationship between pay and performance. **Pay more = get more.** In reality, that relationship is anything but linear. It is governed by a well-established psychological dynamic: **the hedonic treadmill.**

### How the Hedonic Treadmill Works

The hedonic treadmill describes our tendency to rapidly adapt to improvements in our circumstances. This concept, first articulated by psychologists Philip Brickman and Donald Campbell in 1971, showed that even major financial windfalls—like lottery wins—produce only temporary increases in happiness and motivation.

A pay rise, bonus, or promotion creates a short-term spike in motivation, satisfaction, and perceived value. But that spike is temporary. Very quickly, the new level becomes the baseline.

**What was once motivating becomes...expected. And once it becomes expected, it stops motivating.**

And the organisation responds the only way it knows how: **increase the reward again.**

The treadmill doesn't just stall motivation. It rewires how people interpret reward.

## Why This Hits Professional Services Firms Hard

1

The business model is already highly extrinsic. Billable hours, utilisation targets, revenue contribution, bonus pools—it's all measurable, visible, and financially anchored.

2

Paying more for effort in a system where everyone is already working hard doesn't set anyone apart—it just raises the baseline of what people expect to be paid.

3

The partnership model reinforces short-term reward cycles. When profit distribution is the dominant lens, there is a constant gravitational pull toward maximising immediate financial outcomes rather than investing in longer-term motivational systems.

**The result?** Firms unintentionally train their people to run faster on the treadmill, and then wonder why, eventually, they fall off it.

### The Hidden Cost: When Money Crowds Out Better Motivation

I hear a version of this complaint from many professional services clients:

*We pay our people so well! Way better than schoolteachers! They should complain less and just do the work.*

**Yet when I meet with staff, the issue is never about the money.** Typically, it's about challenging market conditions, the incessant grind of the work with no opportunity to recover, and a lack of internal support when things get tough.

Deci and Ryan's Self-Determination Theory shows that when **extrinsic** rewards dominate, **intrinsic** drivers like mastery, autonomy, and purpose begin to erode. What starts as an incentive gradually becomes a transaction.

This dynamic—often referred to as “motivation crowding”—means that the more organisations lean on financial rewards as the primary signal of value, the more they unintentionally narrow how people engage with their work.

**Purpose gets diluted (*why am I actually doing this?*)**

**Mastery becomes secondary (*just hit the number*)**

**Contribution narrows  
(*what do I get? replaces how can we be better?*)**

ELEPHANT  
#2

There are a few hard truths here.

You cannot pay your way to sustained discretionary effort.

You cannot out-bonus a lack of purpose, clarity, or leadership.

You cannot expect yesterday's reward to drive tomorrow's performance.

Money still matters. It always will. It needs to be fair, competitive, and aligned. But it is a **threshold condition**, not a long-term strategy.

The firms that break this cycle do something fundamentally different. They shift the motivational focus:

## The Label

Drawing on the fixed vs learning mindset work of Carol Dweck, organizations should be alert to how labels such as “high performer” are used.

When people become attached to the high performer label, rather than committed to continually developing as one, feedback, mistakes, uncertainty, and the need for support can become threats to their identity.

**Here’s how this plays out for someone with such a fixed mindset.** Any disconfirming information, such as the need for, say, training or constructive feedback threatens the label/status. *If I’m wrong or need help, that means that I am not a high performer.* This thinking can have real consequences for individual learning, growth, and ego.

Here are some specific ways that friction can show up in partners who may have overidentified with their high-performer status:

**They resist or fear constructive feedback.** I’m working with a partner right now who was recently told he takes on too much and doesn’t stand up for his views. His first (and painful) knee-jerk reaction? To wonder why no one had said anything earlier, obsess about what everyone else was therefore thinking about him, and to imagine that the feedback was really a performance management plan in disguise. In his eyes, the feedback was really saying he wasn’t a high performer. When message itself is intolerable, there’s little focus on performance improvement.

**They resent others for not pulling their weight...but are unwilling to invest in them.** This is the leader who tells me, with a sigh, that once again, she's the one left "holding the bag" and doing all the work while others underperform around her. But has no time to slow down to ask for help, much less stop to help those around her get better. It's as if getting help might undermine her status as a, you guessed it, high performer.

**They are simultaneously over- and underwhelmed.** *I've got too much to do but I feel stuck and unable to grow.* No one says this out loud, but getting caught in this vice--being busy while feeling meaningless--is the biggest accelerant of burnout there is. Especially for executives who are ostensibly getting paid too well to complain about it or even acknowledge it.

**They claim (or act like) they have "outgrown" coaching.** **This** is the leader who used to lean into coaching; now he pushes it away. It's the "curse of expertise," where growth stalls because *I don't want to know or am afraid to find out what I don't know* gets reframed as *there's nothing anyone else can teach me.*

If a firm is serious about evolution to the next level, it is important to check and correct for evidence of these fixed-mindset problems, as partners so afflicted will invariably create friction when confronted with the need to change behaviour or learn new skills as the firm grows and changes.

# WHAT HAPPENS WHEN THE “COLLECTION OF HIGH PERFORMERS” MODEL WEARS OUT

## 1 Individual optimisation over firm optimisation

Partners focus on maximizing the performance of their own practice areas rather than the firm as a whole.

This leads to:

- dilution of firm brand value when no one knows what it really stands for
- friction, resentment, and competition between partners and their teams
- fragmented firm strategy
- limited collaboration across practices
- inconsistent staff and client experiences depending on who they interact with

## 2 Leadership without team discipline

Unsurprisingly, when partners bias for their own benefit, the team actually functions more like a group of disparate individuals than leadership teams.

Common dysfunctional behaviours include:

- disengaging from leadership discussions. *This doesn't concern me.*
- resistance---silent or otherwise--to firm initiatives that are seen as irrelevant or counter to individual goals.
- conflict without resolution. When team alignment hasn't been pre-established, partners fight for their individual needs rather than seeing any higher purpose.
- decisions being filtered through personal impact rather than firm impact.

Over time and with organisational growth, several predictable and dysfunctional patterns emerge:

### **3 Cultural inconsistencies**

Without shared behavioural standards, each partner leads their team differently, according to their own values and performance priorities.

#### **The result?**

- uneven staff experiences and perceptions of favouritism
- inconsistent management practices that are personality rather than executive-team driven
- internal friction between practices
- underperformance that is inconsistently addressed, but is commonly known and therefore feeds frustration, especially for more capable staff

### **4 Individual endurance compensates for a lack of system design**

Often, when firms reach this stage, performance pressures continue to be absorbed by individuals rather than addressed structurally. This is the heart of the problem – where structural weakness is a lagging problem indicator—and remains unaddressed.

#### **The result?**

- chronic overburdening of high performers burns them out
- system failures and inequities frustrate everyone
- leadership fatigue from the conflict and grind
- newer or emerging talent leave in search of a better way

**In the short term, these dynamics can still produce strong financial performance.** Rainmaker partners and their teams continue to deliver revenue.

However, over time, the system begins to show strain as people get frustrated, burn out, or leave. Processes slow down or even stop.

## From Individual to System Champion

In the late 1980s, the NBA's **Chicago Bulls** had the best individual player in basketball: **Michael Jordan**. He was a dominant, high-output performer, arguably the most talented player of his generation.

**But while he was winning scoring titles, the team was not winning championships.**

When Phil Jackson became head coach in 1989, the shift he made was not about adding more talent. It was all about reducing dependence on Jordan and building a whole-team system.

Jordan was issued his own marching orders:

- less scoring, more passing;
- giving up on the NBA scoring title,
- no more “superstar” treatment.

The transition was not immediate. It took nearly two seasons of tension, adjustment, and Jordan's gradual buy-in before the system fully took hold — culminating in the Bulls' first championship in 1991.

## A SPORT SUPERSTAR CASE STUDY

**After that? The trajectory was clear:**

- Pre-shift (individual-led): No championships
- Post-shift (system-led): 6 NBA championships (1991–1993, 1996–1998)

The transition was not easy. Even the most competitive, high-performing individual in sport did not naturally default to system-based performance. It took a great coach, patience, conflict, and continual reinforcement.

**And it had to be learned.**

**Professional services takeaways?** What got you here can be emotionally and professionally hard to let go of — even when it's obvious. And it won't get you where you want to go if sustainable growth, efficiency, and aligned performance is the goal.

# SYSTEM IMBALANCE PERFORMANCE IMPLICATIONS

The “collection of high performers” model produces several forms of performance drag that are often invisible in the short term but become significant over time.

## THESE INCLUDE:

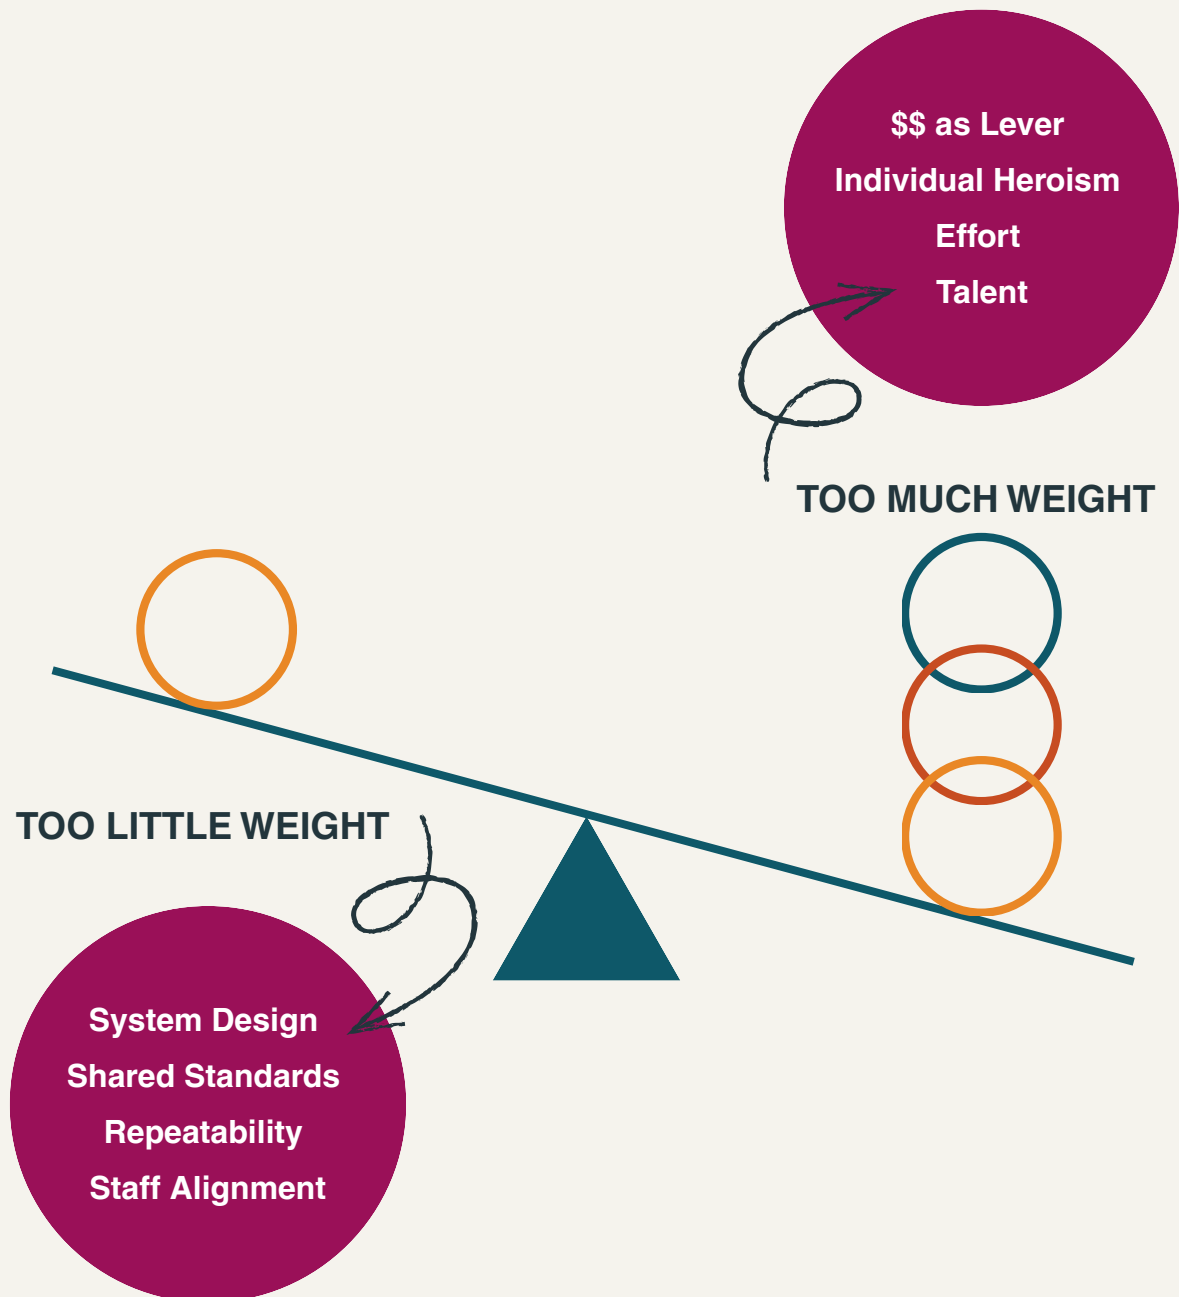

In true high-performance environments — such as elite sport — these dynamics would be treated as system design, not individual staff problems.

Professional services firms often attempt to solve these problems with the same levers: some form of individual resilience training or via financial incentives (promotions or pay raises). While perhaps useful in the short term, these interventions do not address the underlying **performance system inadequacies**.

# WHAT UNBALANCED PERFORMANCE LOOKS LIKE

# THE SHIFT: FROM INDIVIDUAL EXCELLENCE TO A PERFORMANCE SYSTEM

True high-performance organisations operate differently. They do not rely solely on exceptional individuals. Instead, they build systems that allow individual excellence to compound.

The shift requires three fundamental changes:

The most important transition is psychological. Partners move from seeing themselves solely as **individual performers** to seeing themselves as **leaders and stewards of the firm's performance system**.

Individual performance remains important — but it is no longer the sole measure of success.

High-performing leadership groups share clear expectations about how members participate. In most partnerships, these expectations remain implied and therefore unenforced. In elite teams, these behavioural standards are explicit and provide guardrails for everyone to see and abide by.

Making them explicit, behavioural, and enforceable is a critical step toward more effective—and impactful-- collective performance.

Rather than asking individuals to keep absorbing system strain, high-performance organisations design environments that support sustainable performance.

**The goal is to create a system where sustainable high performance becomes the default rather than the result of extraordinary individual effort.**

## The Critical Performance Enabler: *Psychological Safety*

**Psychological safety is often misunderstood in performance-focused environments.**

It is not about lowering standards, avoiding difficult conversations, or creating comfort for its own sake.

At its core, **psychological safety is the ability for individuals to speak up, challenge, admit mistakes, and ask for help without fear of negative consequences.**

This is not a cultural “nice to have.” It is a high-performance requirement.

In its absence, predictable patterns emerge:

- feedback is withheld or diluted
- risks and concerns are raised too late
- mistakes are hidden or repeated
- leaders prioritise reputation over improvement

While these environments may appear professional on the surface, underneath, performance silently suffers [and if not addressed, these will compound].

**Safety alone, however, is insufficient.**

High-performance cultures also require safe **accountability** — an environment where individuals are both:

- safe to contribute openly, and
- expected to perform, improve, and take responsibility for actions and outcomes

This balance is critical. **Without accountability, safety can lead to complacency and downgraded standards. Without safety, accountability can feel like punishment and backfire.**

**Leaders play a decisive role.**

Psychological safety cannot be mandated; it is established through consistent leadership behaviour — particularly in how leaders use strategic vulnerability to share their own mistakes, respond to challenge, and engage with feedback.

This requires a **top-down** culture shift.

In practice, this means:

- making it safe to acknowledge errors, but not to repeat them
- treating challenges as opportunities to learn
- providing clear, timely, and actionable feedback
- reinforcing explicit standards of behaviour and performance
- leaders modeling vulnerability rather than merely demanding it from everyone else

**Psychological safety, combined with accountability, enables faster learning, earlier problem resolution, and more consistent execution.**

It is therefore a foundational element in any high-performance system.

# THE OUTCOME? A HIGH-PERFORMANCE CULTURE

When these elements align, the firm begins to operate as a coordinated performance system with these tangible benefits:

## Stronger strategic execution

Partners align around firm priorities rather than individual agendas. They speak as one voice, which increases organizational clarity and speeds better decision-making

## Greater collaboration

Practices work together more effectively, strengthening relationships and client offerings.

## Leadership credibility

CEOs or managing partners can lead the firm with clearer authority and alignment, which speeds decision-making and increases clarity of messaging.

## Increased psychological safety

People are more able to “lower the armour” of self-protection, speak more freely, admit vulnerabilities, and provide peer and leadership feedback.

### **Talent retention/attraction**

Emerging leaders experience more consistent management and development. Recruiting becomes easier as word gets out that this firm is a good place to work.

### **Client impact**

Clients receive a more cohesive and reliable firm experience.

Ultimately, the shift improves the metrics leaders care most about:

- ★ **SUSTAINED REVENUE GROWTH**
- ★ **IMPROVED TALENT RETENTION/ATTRACTION**
- ★ **STRONGER PARTNER ALIGNMENT**
- ★ **GREATER STRATEGIC AGILITY**

Firms that adopt this approach become employers of choice, with knock-on effects when attracting and recruiting new talent.

# KEY QUESTIONS THAT MOVE FIRMS FROM A TO B

For partnerships seeking to evolve from a collection of high performers to a high-performance culture, these are the questions to start asking.

## About leadership behaviour

- What behaviours are expected of all partners when they operate as an effective leadership team?
- What behaviours undermine the effectiveness of the partnership?

This can create a useful “above the line/below the line” metric but is only as useful as it is seen and universally understood.

- Are those expectations explicit and consistently enforced?
- Who is responsible for enforcement? The leader, or will the team police each other? Or both?

## About the partner role

- Do partners typically defend their own practice? Are they willing to sacrifice personal advantage if doing so helps the firm?
- How is firm stewardship as partner responsibility defined, recognised, and rewarded?

---

## About collaboration

- Where does the current system encourage undesirable within-firm competition rather than cooperation?
- What opportunities for between-firm practice collaboration can we exploit?
- What or who prevents firm practices from working together effectively?

---

## About performance sustainability

- Where is the system relying on individual endurance rather than structural support? Do we even know who those people are?
- How does the firm presently support or provide flexibility to enhance performance? What are staff wanting in this space?
- What pressures repeatedly produce burnout cycles?

---

## About the future of the firm

- What is this firm truly capable of if we were to think big or outside the box?
- What kind of leadership culture will the next generation inherit?
- Will the current system sustain the firm's performance over the next decade?

The firms that ask and answer these questions honestly make the shift from **a group of successful individuals to a true high-performance organisation.**

# ARE YOU READY TO MOVE?

Make no mistake...while these are the questions to ask, this can be an incredibly difficult process to execute from the inside. When we live in the system, it can take some serious mental gymnastics to even begin to see ourselves from a different, elevated, or external perspective. Much less lead others to do the same.

This is where an outside facilitator can be worth the investment. Someone with different perspectives and experience. Someone willing to ask the important, sometimes confronting questions. This also allows everyone, including all of leadership to be IN the conversation rather than sitting above, trying to lead it.

**That's where I come in.**

## Who am I?

I'm Dr Kirsten Peterson, a 7x Olympic performance psychologist who has spent three decades working inside high-performance environments including professional services.

I work with professional service leaders, executive teams, and organisations navigating growth, pressure, uncertainty, and the human realities that sit underneath performance. My work focuses on helping firms move beyond dependence on individual over-gritting toward more sustainable, aligned, and psychologically healthy high-performance cultures. I do this through a bespoke combination of whole-firm culture reviews, individual and team leadership coaching, and firm teambuilding.

This is the work I love to do. If the ideas in this paper resonate with you or your leadership team, get in touch.
